

A loyal customer

[Wavin](#) has already opted for a Bolidt synthetic floor finish several times. Recently, it was the turn of building U00, where piping, connectors and couplings are made to size. Because of commercial changes in the market of PVC pipe systems, a renovation was in order. [Bolidtop® 700](#), the optically attractive synthetic flooring that is designed to stand hard wear, was chosen for the building.

Wavin, specializing in the development, production and sale of synthetic pipe systems, has had long, strong ties with Bolidt and its floor finish systems. In their injection moulding factory in Hardenberg, these floors have been subjected to rough treatment for years. The Automatic Guided Vehicles that form a part of the fully automated production process, have been following exactly the same route, day in day out, 365 days a year. It is amazing to see that after years of intensive use, only at the bends signs of wear are showing on the electrically conductive [Bolidtop® Stato 525](#).

The Bolidtop® 700 was installed in another [production](#) area 7 years ago. It still beams with durability. Could this be the reason why Wavin has chosen to work with Bolidt again this time?
